

AMEYA KULKARNI

ameyakulkarni2023@gmail.com | +1 (647) 450-7020 | [GitHub](#) | [LinkedIn](#) | [Portfolio](#)

Electronics and Computer Science Engineering graduate with hands-on experience in Android development and VS Code extension engineering. Proficient in Jetpack Compose, Kotlin, TypeScript, and SQL, with a strong focus on building user-focused solutions. Enjoys tackling low-level technical problems and shipping tools that solve real developer pain points.

EXPERIENCE

Business Transformation Intern

May 2026 – July 2026

Edelweiss, EAAA

- Authored Standard Operating Procedures (SOPs) from scratch for the Business Transformation team, establishing structured, repeatable workflows that improved cross-functional coordination between business and technical stakeholders.
- Authored a whitepaper proposing the design and rollout framework for EAAA's new command center, translating operational requirements into a structured technical blueprint.
- Coordinated vendor onboarding calls and documented User Acceptance Testing (UAT) processes, establishing clear handoff criteria between business teams and technical implementation partners.
- Contributed to SAP stabilization efforts post-rollout by coordinating with implementation partners to troubleshoot issues and align system behavior with business workflows.
- Applied a systems-thinking lens from software engineering to enterprise process design, mapping how technical decisions in ERP and vendor systems cascade into operational workflows.

Technical Mentorship Project

July 2025 – March 2026

Mentor: Nirbhay Pherwani

- Built a modern Android application using Jetpack Compose, Kotlin Coroutines, and MVVM architecture.
- Optimized complex UI screens by profiling recomposition counts, stabilizing state holders, implementing stable keys, and reducing overdraw, resulting in smoother animations and improved UI responsiveness.
- Designed and implemented secure, principle-of-least-privilege Firebase security rules, including ownership validation, index-based queries, and nested data protections.
- Developed adaptive UI layouts with dynamic font scaling and accessibility support for improved usability across device types.
- Implemented real-time data flows with Firestore, optimizing listener strategies and leveraging caching to reduce redundant updates.
- Explored product-driven improvements by analyzing user engagement patterns, onboarding friction points, and behavior-based retention metrics.

SKILLS

Development: Android (Jetpack Compose, Kotlin, Java), TypeScript, SQL, HTML, CSS, JavaScript

Tools: Git, Firebase, AWS S3, VS Code Extension API, SQLite, Protocol Buffers

Methodologies: Event-driven Architecture, System Design, Database Optimization, Reverse Engineering

Soft Skills: Strategic Problem-solving, Team Collaboration, Leadership

EDUCATION

Master of Information, Information System & Design

2026 – Present

University of Toronto

Bachelor of Engineering, Electronics and Computer Science

2021 – 2025

SIES Graduate School of Technology, Nerul | CGPA: 8.73

PROJECTS

1. [Orbit Hub](#)

Built a VS Code sidebar extension for Anti-Gravity users showing live AI quota across multiple accounts with reset countdowns and last-fetched timestamps. Engineered a custom SQLite WAL merge engine in TypeScript that replays uncommitted frames into a memory buffer and patches two header bytes to bypass sql.js's WAL mode restriction. Wrote a

zero-dependency protobuf byte walker to decode binary quota values without a schema, and a persistence layer that estimates quota recovery from cached reset timestamps.

2. [LLMetrics](#)

Built a VS Code extension that passively captures all LLM API traffic by monkey-patching Node.js http, https, http2, and fetch internals - zero configuration required. Injects a live network interception probe into Cursor sibling processes via the V8 Inspector Protocol. Decodes protobuf conversation storage using a custom pure-TypeScript SQLite page reader with WAL support. Provides real-time token and cost tracking, six anti-pattern detectors, and an AI coaching layer powered by Groq LLaMA 3.3 70B.

3. [Vanish](#)

Real-time messaging app where messages disappear immediately after exiting the chat. Chat only begins when both users are online. Built using Jetpack Compose, Kotlin, Firebase Firestore, and AWS S3. Zero message history and no data storage for complete privacy.

4. [Two Cars](#)

High-performance mobile game with dual-car simultaneous control, built without a third-party game engine. Implemented a bespoke game loop with delta-time interpolation, MVI pattern with unidirectional data flow, combo/achievement systems, and Firebase Remote Config for live theming. Delivers smooth 60 FPS using Jetpack Compose's custom canvas.

5. [NearChat](#)

A fully decentralized Android chat app using Bluetooth Classic RFCOMM - no internet, Wi-Fi, or cellular required. Implemented a star topology relay for group messaging to work around Bluetooth Classic's mesh networking limitations. Built a custom handshake protocol that silently intercepts and redirects stale connection attempts caused by Android's aggressive Bluetooth name caching. Managed socket lifecycle using Kotlin Coroutines and ViewModel scoping to prevent zombie sockets across app backgrounding and disconnections.

CERTIFICATIONS

[Android Jetpack Compose Bootcamp](#) | [Kotlin for Java Developers](#) | [Complete Java Development Bootcamp](#) | [Software Architecture & Design of Modern Large Scale Systems](#) | [MySQL Bootcamp: SQL Beginner to Expert](#)

VOLUNTEER WORK / EXTRACURRICULAR ACTIVITIES

IEEE - Event Head

- Attracted 200+ participants as Event Head and hosted a webinar with 200 students.
- Developed communication strategies that increased event attendance by 40%.

NSS - National Service Scheme Volunteer

- Organized a Dream Run attracting 300-400 participants and led a blood donation camp with 250-300 donors.
- Coordinated a tree-planting initiative resulting in 1000+ trees planted.
